

Technical Report: Automated Obituary Generation

Ashish Upadhyay

April 16, 2020

Aim

This document gives an overview of a **Flask-Service** created to support the **Case-Based** process for the automated obituary generation.

1 Natural Language Generation

Natural Language Generation (NLG) is one of the sub-field of Artificial Intelligence (AI) where we aim to generate a text/document from non-linguistic input. In our case the main challenging task is to develop an automated **data-driven** process for the generation of obituaries. For this we choose to use a Case-Based Reasoning (CBR) approach which applies lazy learning algorithm for the automated NLG. CBR provides a way to dynamically generate different templates from previous data. A series of experiments were performed to choose best possible algorithm for various sub-tasks in the NLG process.

A technical paper on experiments is accepted at the International Conference on Case-Based Reasoning (ICCBR) - 2020. Please refer to that document for NLG and CBR related stuff.

2 REST API

An RESTful API has been developed to support the NLG process so that it can be easily integrated wherever possible. The service is a RESTful API that takes POST request (input features) from a form and pass it to a CBR component which generates four different obituary texts to be send back.

The code-base for the API is uploaded on a private GitHub repository for sharing with the concerned members. The link to the API is:

<https://github.com/panditu2015/Obituary-Generation>

A brief explanation for the code-base is given in the following sections.

2.1 Directory Structure

The directory structure of the code-base is as follows:

```
Obituary-Generation (root directory)
├── app (flask-services)
│   ├── messages (CBR component)
│   │   ├── data (case-base for the CBR component)
│   │   │   ├── basic.csv
│   │   │   ├── funeral_component.csv
│   │   │   ├── personal_component.csv
│   │   │   └── relations_component.csv
│   │   ├── resources (a list of features categorised in different components)
│   │   │   └── feature_list.csv
│   │   ├── __init__.py
│   │   ├── basic.py
│   │   ├── erros.py
│   │   ├── funeral.py
│   │   ├── main.py
│   │   ├── personal_info.py
│   │   ├── relations.py
│   │   └── README.md (instructions specific to CBR component)
│   ├── templates (HTML templates for flask app)
│   │   └── index.html
│   ├── __init__.py
│   └── routes.py (file for all the routes)
├── labelling (framework for data labelling and creation of case-base)
│   ├── data (final tabular representation created)
│   │   ├── basic.csv
│   │   ├── funeral_component.csv
│   │   ├── personal_component.csv
│   │   └── relations_component.csv
│   ├── resources (jsonlines and xml files)
│   │   ├── tagged.jsonl (tagged obituaries downloaded from doccano)
│   │   ├── xml-tagged.xml (tagging in xml version)
│   │   └── xml-tagged-comps.xml (same tagging done component wise)
│   ├── create_csv.py
│   ├── create_csv_comps.py
│   ├── create_xml.py
│   └── README.md (instructions specific to data labelling)
├── reports (technical reports)
│   ├── images
│   │   ├── basic.png (example output from basic-retrieval method)
│   │   ├── comps.png (example output from component-retrieval method)
│   │   └── input-form.png (screen capture of input form)
│   └── flask-app-report.pdf
```

```

├── ICCBR-accepted-paper.pdf
├── migrations (database stuff: can be easily ignored)
├── .gitignore
├── cbrobit.py (main flask-app file)
├── LICENSE (currently licensed as GNU v3.0)
├── README.md (main instructions file)
└── requirements.txt (required libraries to run the app)

```

It is noted that the files which are not mentioned here and still available in the repository might not be useful and thus can be easily ignored.

2.2 Using the App

To run the app, please install the required libraries by using the following command from inside the **Obituary-Generation** directory:

```
$ pip install -r requirements.txt
```

Now to run on:

- Unix Bash (Linux/Mac):

```
$ export FLASK_ENV='development'
$ export FLASK_APP='cbrobit.py'
$ flask run
```

- Windows Powershell:

```
> $env:FLASK_ENV='development'
> $env:FLASK_APP='cbrobit.py'
> flask run
```

- Windows CMD:

```
> set FLASK_ENV='development'
> set FLASK_APP='cbrobit.py'
> flask run
```

After starting the service, go to the following link where a form will appear:

<https://localhost:5000>

A screen capture of the form is shown in fig. 1. After submitting the form by clicking the submit button, a json file will appear on :

<https://localhost:5000/result>

The input json will contain all the input features in **attribute-value** pair and four generated obituaries from those features. In figs. 2 and 3, we can see the possible outputs for both **basic** and **component** retrieval methods respectively.

Please enter the values

Name	Spouse Name	Funeral Place
Nick Name	Children Name	Funeral Date dd/mm/yyyy
Gender Male	Grand Children Name	Funeral Time
Place of death	Great Grand Children Name	Cemetery Place
Date of death dd/mm/yyyy	Children-in-law Name	Cemetery Time
Age	Siblings Name	Funeral Message
Demise how Peacefully	Siblings-in-law Name	Guests List Private
Demise Reason	Friends Name	Attire Request
Home town	Other Relations Name	Charity Name
Retrieval Method Component		
submit

{
  "Option 1": "John Doe peacefully, at Aberdeen, on 31 March 2020, Johnny, aged 80 years (formerly of the Dundee) - much loved husband of Jane Doe, loving father of John Jr. and Jane Jr., father in law and best papa in the world to Olivia, Olivia Jr., a dear brother-in-law, uncle and good friend to many.\\n\\nFuneral service at Church of Scotland, Aberdeen on 07 April 2020 at 10:30, interment thereafter at Molbourn Cemetery, friends and family respectfully limited (Black or grey kilts welcome). Donations if so desired to British Heart Foundation."
},
{
  "Option 2": "John Doe peacefully at Aberdeen on 31 March 2020, Johnny, aged 80 years of Dundee. - Thomas (Tae) much loved and devoted husband of Jane Doe, a dearly loved father of John Jr. and Jane Jr., father in law of Olivia, a doting papa to Olivia Jr. and a friend to many. Our hearts are broken.\\n\\nFuneral service will be held at Church of Scotland, Aberdeen on 07 April 2020 at 10:30. Funeral thereafter to Molbourn Cemetery for 12:00, friends and family are respectfully limited. Family flowers only please, in lieu, donations for British Heart Foundation would be appreciated."
},
{
  "Option 3": "John Doe peacefully at Aberdeen on 31 March 2020, Johnny, aged 80 years, formerly of Dundee. - Much loved husband of Jane Doe, father of John Jr. and Jane Jr., father in law of Olivia and papa of Olivia Jr.. Will be sadly missed by all of the families and her many friends.\\n\\nFuneral service will be held at Church of Scotland, Aberdeen on 07 April 2020 at 10:30, to which friends and family are respectfully invited, followed by interment at Molbourn Cemetery, arriving approximately 12:00. Family flowers only please as there will be a retail collection for those wishing to donate to British Heart Foundation."
},
{
  "Option 4": "John Doe peacefully, in the tender care of Aberdeen, on 31 March 2020, Johnny aged 80 years, of Dundee. - Violet (nee Armstrong). Beloved husband of Jane Doe, much loved father of John Jr. and Jane Jr., loving father in law to Olivia. Devoted papa to Olivia Jr.. Cherished great grandmother to Rebecca, Daniel, Jake, Cassie, Madison, Tori, Leigh, Megan, Faith and Niall and aunt of the family.\\n\\nFuneral service to which friends and family are respectfully invited at Church of Scotland, Aberdeen on 07 April 2020 at 10:30, thereafter to Molbourn Cemetery at 12:00. Family flowers only please. A collection will be taken on retreat for British Heart Foundation."
}
}
```

Figure 3: Output in Component-Retrieval method.

2.3 Case-Base

2.3.1 Creation

The case-base is generated using a semi-automated process. First a manual labelling is done for 100 samples to annotate the **attribute-value** pairs using a open-source sequence labelling app named **doccano**¹. The app generates a **jsonlines** file in the popular CoNLL format that can be found at:

```
/Obituary-Generation/labelling/resources/tagged.jsonl
```

The **jsonlines** file contains a **json** object in each line, where each object will have a key **text** with a string non-annotated obituary as value and **labels** with a list of all features in that text followed by there starting and ending index in the obituary string. The **jsonlines** file is then converted into a **xml** file using the following script:

```
/Obituary-Generation/labelling/create_xml.py
```

which will create the following file:

```
/Obituary-Generation/labelling/resources/xml-tagged.xml
```

Note this will create the tagged file for **basic-retrieval** method. To create the **component-retrieval** tagged file, a further manual annotation is required to segregate the obituary sentences into different components. The **component** version of above file can be found at:

```
/Obituary-Generation/labelling/resources/xml-tagged-comps.xml
```

Now that we have the **xml** files, we can run the following code to convert them into a tabular format stored in **csv** files:

For **basic-retrieval** method:

```
/Obituary-Generation/labelling/create_csv.py
```

this will create the following file:

```
/Obituary-Generation/labelling/data/basic.csv
```

For **component-retrieval** method:

```
/Obituary-Generation/labelling/create_csv_comps.py
```

this will create the following files:

```
/Obituary-Generation/labelling/data/personal_component.csv
```

```
/Obituary-Generation/labelling/data/relations_component.csv
```

```
/Obituary-Generation/labelling/data/funeral_component.csv
```

Feature	Component	Frequency
name	Personal Info	125
age	Personal Info	47
demise_place	Personal Info	89
demise_date	Personal Info	101
demise_how	Personal Info	91
demise_reason	Personal Info	11

funeral_message	Funeral	4

Table 1: Identified features with their frequency.

2.3.2 Features

From the currently labelled 100 samples, the 42 identified features with their respective frequency is shown in table 1.

2.4 Future Work

The possible future works to update the application can be:

- Add a deep learning framework for the solution adaptation.
- Add an active learning framework for data labelling.
- Automate the process of sequence labelling.
